H-B ToonSuite v17 – What's New

This version is built to make working with characters faster and to cut down on repetitive work.

🎭 Character Manager

Save every character you build once, and reuse it whenever you like.

- **Two ways to save:** Right-click any folder and save the character either *without animation* or *with animation*.
- **Characters panel:** The **Characters** button in the top menu opens a visual library of all your saved characters. Each card is tagged **STATIC** (no animation) or **ANIM** (animated).
- **Live preview:** Animated cards have a slider underneath. Drag it left and right to watch the animation without bringing the character into your scene.
- **Drag and drop onto the stage:** Drag a character from the panel and drop it on the stage. If another character already has the same name, a number is added automatically (for example "Fred 2" and "Fred 3").
- **Transfer motion:** Drag the animation from one card and drop it onto the folder of any other character.
  - If that folder already has an animation, you are asked whether to **add** the new motion or **replace** the old one.
  - The motion is applied only to layers whose names match the layers of the original character.

🗂️ A tidier Layers panel

- **New toolbar:** The **Eye, Freeze, Lock and Solo** buttons now sit together in one neat bar under the "+ Folder" button, and they work on everything you have selected at once.
- **Easier renaming:** When you rename a layer, the text box now spans the full width of the row, so you can see the whole name.

🔑 Keys and the Graph Editor

- **Separate key for image swaps:** The Over/Under key (whether a layer sits above or below others) is now separate from the image-sequence key. Each one appears on its own in the key filter and in the Graph Editor.
- **Curves for your selection:** Select any layer or folder on the stage and its curves for move, rotate, scale and effects appear in the Graph Editor.
