Fixes and New Features

English translation of the update notes

Camera

Graph Editor

- Camera curves (X, Y, Zoom, Rotate) now behave like any other element in the graph.
- Box selection works, along with Shift, Ctrl, and Select All.
- Group moves in value and time work, as do the Value/Frame fields, Delete, and Insert Key.
- The Auto, Spline, Clamped, Linear, Flat, Stepped, and Plateau tangents can be applied to several points at once.
- In and out handles can be dragged freely.
- Each key's value is shown next to its point.
- A Camera filter and camera channel rows were added, just like layers. The Camera button also shows its state correctly.
- The All and "Show every animated channel" buttons restore everything: the filter, the channels, and the camera curves.

Timeline

- New camera key filters: Cam Move, Cam Zoom, and Cam Rotate.
- The tangent menu and Reverse Keys now work on camera keys.
- Copying and pasting a camera key preserves its tangent.
- Tangents are saved with the project, and Set Key keeps them on the same key.
- Undo and Redo work for the camera.

Clay

- **Smooth** removes wrinkles and creases.
- **Mask** locks an area with a colored brush, **Thaw** erases the mask, and **Clear** removes the whole mask.

- The **Hide** checkbox temporarily hides the mask color, but the mask still protects the area.
- The mask is not saved in the project. It lasts only while the app is open.
- The panel modes are now one click away: Warp, Smooth, Erase, Twirl, Pucker, Bloat, Mask, and Thaw.
- The brush has Hard, Soft, and Custom options, with a slider next to them.
- The **Circle** slider adjusts the opacity of the color inside the brush circle.
- The same opacity setting and the mask opacity are also available in Settings.
- A new **Reset** button works in both modes. It removes the Clay effect on the current frame, or on the selected keys in the timeline.
- **Alt+Click**: the layer you select becomes the Clay layer. This now works in the layers column, in folders, and in Spread mode. If several layers or folders are selected, the layer under the mouse becomes the Clay layer.

Undo and Redo

- Redo was not being cleared after an Undo. This is fixed.
- Undo and Redo now work in every situation: deleting a layer or folder, moving, heavy Clay work, and the camera.
- Settings changes and free movement in the scene (zoom and pan) no longer enter the Undo history.
- Undo works even after using sliders.
- Undo, saving, and loading a project used to lose Clay animation keys. This bug is fixed.

Link

- **Unlink** works from the chosen frame onward. Before that frame the child stays with its parent, and it becomes free from that frame.
- No extra keys are created on other frames.

Settings and Appearance

- New colors in Settings: brush circle, Clay grid lines, mask brush, stretched frames, and grid colors.
- New shortcuts have been added to the shortcut list.

- New defaults: scene background 200/200/200 and outside-frame area 80/100/120. The old default colors change to these automatically.
- A subtle grid, like those in 3D apps, now appears on the scene, with horizontal and vertical center lines.
- All grid options are adjustable: spacing, a major line every N cells, opacity, thickness, and snap step.
- A Grid button and a Snap checkbox sit at the top of the scene. With Snap on, layers and folders snap to the grid as you move them.

Top Bars and Left Tools

- The layer/folder bar and the camera bar now share a single top drawer, so they no longer overlap. On wide screens they sit side by side.
- The drawer opens when you hover over its tab or drag it down, and closes automatically when the mouse moves to the scene. The 📌 button keeps it open.
- The top-right bar (Grid, Snap, Undo/Redo, zoom, Reset View) is now a sliding drawer too.
- In the left tool column, clicking an active tool again turns it off, so you no longer need to press None. Clicking another tool turns off the previous one. Offset and Camera work the same way.

Timeline (Additional Fixes)

- Set Key and double-click no longer create dummy keys when the scene is empty.
- Existing empty keys are removed automatically.

Graph Editor (Additional Fixes)

- Curves and keys that only swap the image (swapping imported images) were removed from the graph, so they no longer get mixed in with motion. The keys for these swaps are still in the timeline.
- Deform channel points, such as Bend, were sometimes unselectable. This is fixed.
- The logic for the Auto filter and channels is now unified.

Closing the App

- Closing the app now opens a dialog with these options: Save, No (close without saving), Reset, Open..., and Cancel.
- The File menu also has a Project Reset option.
- For the Windows version, this dialog must be connected to the app window's close event. The code for it was provided earlier.
